Climate or Weather???

Weather refers to the short-term phenomena

Climate refers to the long-term patterns

Better yet!

Climate is your personality.....

Weather is your mood.....

Somerset, NJ Afternoon of March 7

Yup, a tree “visited” the backyard during the storm.
Small dogwood was cleared off before branches broke

Natural mechanisms influence climate

Natural mechanisms

Changes in solar output

Changes in the amount of volcanic aerosols in the atmosphere

Internal variability of the coupled atmosphere-ocean system
(e.g., ENSO, monsoon systems, NAO)

Is climate presently changing in NJ & elsewhere?

Preponderance of evidence suggests climate change is occurring and humans are responsible for a significant portion of recent changes

1. Theory
2. Observations
3. Models

Human factors also influence climate

Non-natural mechanisms

Changes in the concentrations of atmospheric greenhouse gases →

Changes in aerosols and particles from burning fossil fuels and biomass
coal (sulfate aerosols) – cooling
biomass (black carbon) – warming

Changes in the reflectivity (albedo) of Earth's surface and the hydrologic cycle

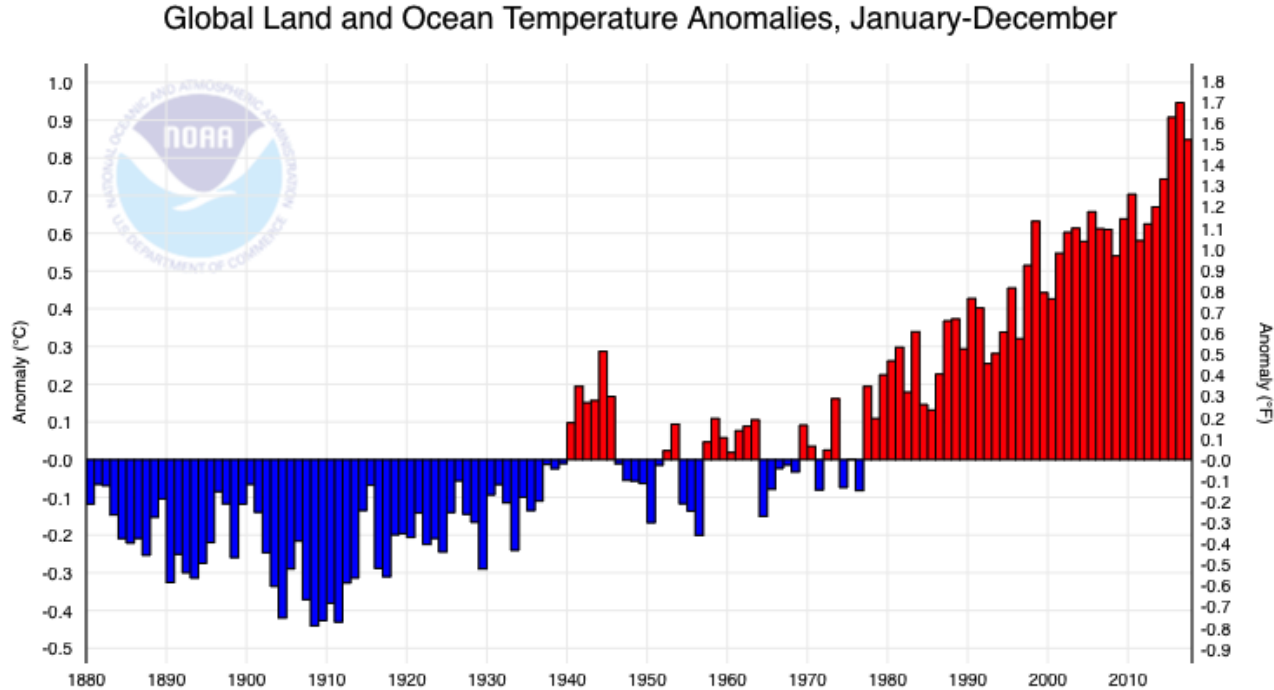

Smoke from fires in Guatemala and Mexico (May 14, 1998)

Greenhouse Effect

- The Earth reflects radiation not absorbed by the atmosphere & surface (lost heat).
- Strong **greenhouse gases** delay the exit of absorbed radiation back to the space (enhancing atmosphere & surface temperatures).

Global surface air temperatures over ocean and land: 1880-2017

NOAA

- Evidence of current global warming
 - 9 of 10 warmest years on record occurred since 2005 (since 1880)
 - Global temperature increasing at 0.13°C per decade
 - Ocean temperatures increasing to depths of 9800 feet
 - Sea level rise
 - Temperatures in Arctic increasing at twice global rate

New Jersey annual temperature; 1895-2017

New Jersey, Average Temperature, January-December

— Avg Temperature — 1981-2010 Mean: 52.8°F — 1895-2017 Trend +0.3°F/Decade

Long-term upward trend
of 2.2°F per 100 years

More rapid warming
since 1980

The three warmest
years have occurred
since 1998

2012 was the warmest
year on record

data source: National Centers for Environmental Information

New Jersey annual precipitation: 1895-2017

Long-term upward trend
of 4.1" per 100 years

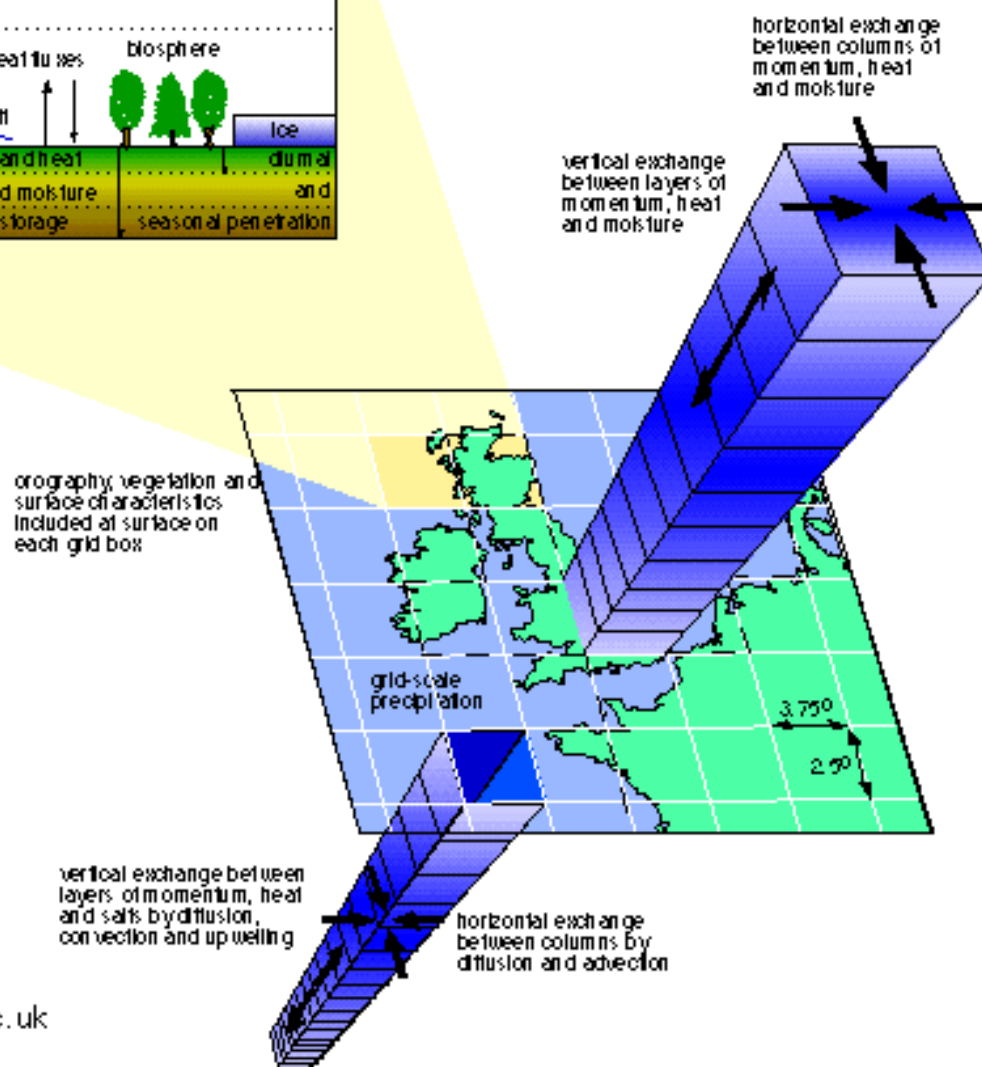

Large decadal variability
(early 1960s drought,
wet 1970s, very wet in
last decade)

Most of the upward
trend comes from
changes in spring and
fall

data source: National Centers for Environmental Information

Coupled Climate Model Schematic

3. Impacts and potential actions

Potential climate change impacts

United States Environmental Protection Agency

A dilemma

Passaic flooding: March 2011

Is there something we should be doing about this climate dilemma?

Challenges Requiring Attention

- **Knowledge:** Develop a better understanding of the details of future climate change.
- **Mitigation:** Reduce emissions of carbon dioxide and other greenhouse gases.
- **Adaptation:** Increase the resilience of society to climate change.
- **Activism/Leadership:** Raise public awareness of the challenges posed by climate change and the need to mitigate and adapt. Participate.....vote.

Summing up:

Be it weather moodiness or long-term climate personality changes, a dull moment is rare to find in New Jersey and beyond.

There is abundant evidence that the atmosphere, oceans and continents are primed to produce even more action, more variability, and more change in the decades ahead on local to global scales.

Continued vigilance is required to monitor, understand and predict the future behavior of the climate system.

The climate change train has left the station, however time remains for mitigative and adaptive actions to slow the locomotive.

Keeping an
eye on
conditions
